

# Certification testing process

Once the development is finished, the provider must contact us in order to arrange the certification testing. This process confirms that the partner has implemented the API as expected and this provider will be able to distribute the product without any technical issue.

1. Fetch hotel information with the OTA\_HotelDescriptiveInfo call. Manageable properties with their rooms and meal plans will be always returned. Additional static information may be returned if the hotel has loaded it in the system:
2. Availability request.  
Get availability. Check acknowledgment of rates, promotions and cancellation policy.
3. Availability request error.  
Confirm error response management. For example submitting a wrong user or password.  
When there is no availability any error is returned, only an empty response.
4. Availability request for two rooms with same occupation.  
The "quantity" attribute can be used to get availability for multiple rooms with same occupation.
5. Availability request for two rooms with different occupations.  
If the occupation to be requested is different, then a different RoomStayCandidate element for each room must be provided. Each room has to include the specific RPH id to identify the room within the response.
6. Reservation request  
Make a test booking for one available room and rate providing your booking reference as ResID\_Value.
7. Reservation request with promotion  
Make a test booking for any available room and rate with promotion.
8. Reservation request for Package rate  
Make a test booking for the package rate. Confirm that you are able to identify the rate plans with the tag @RateTypeCode=package in the Avail response and filter this rate plan for hotel+flight searches ONLY. If possible, please add a screenshot of your own system showing the different results for hotel searches vs hotel+flight searches.
9. Booking with two rooms with children and babies.  
Make a test booking with 2 rooms, including children and at least one baby. Ensure you provide the children's age.
10. Modification request  
Make a booking providing an existing ResID\_Value. This way the reservation will be amended instead of being duplicated. Bear in mind the final status of the reservation is always expected. If you provide a reservation with 2 rooms and initially had 3, one room will be automatically cancelled. On the opposite way, if you submit a reservation with 3 rooms and initially had 2, a room will be added.

11. Booking request error.

Confirm error management. Make a booking with a wrong room code to get an error.

12. Cancel Request

Cancel a booking. All the rooms from the reservation will be cancelled. In case a cancellation penalty is applied, confirm acknowledgment of the penalty from the cancel response.
